

Radio Remote Control - Underground Load-Haul-Dump

Safety? Productivity? BOTH?

Minings go deeper than before, there's a big conflict between productivity and LHD operator's safety. Go deeper, more productivity, lower safety. How can we deal with that? Radio Remote Controls of LHD allow operation a load haul dump from a distant location. The radio remote control is designed to achieve effective performance while being exposed to the hazardous conditions of underground mining. It can guarantee not only the higher productivity but also the higher safety.

Paul Smith, general supervisor, at Barrick Goldstrike. "We had to plan on portable radio remote controls because there was no way we could mine down there without them," Smith recalled. "You didn't want to put any operators at risk in the event of a rock fall or cave-in, and with the kind of fractured ground we were dealing with, those were definite and serious possibilities. This is unsupported ground."

Another problem is the high cost of equipment replacement. Alpha's remote control system is designed to adjust a little on current equipment, and make operation remotely. Little change but great return.

>> Advantages:

- Easy to install and update online;
- Video surveillance supported (optional);
- Customization based on your branded LHD;
